

filters quite well, the media needed to be upgraded. After months of tests, two different types of filter media were introduced. The first media is the cellulose media, a tightly wound paper-like media that filters out water and anti-freeze that may have gotten into your oil. The other media is a synthetic media that has been created through a melt-blown process. This synthetic filter lasts 2-3 times longer than the standard cellulose filter. The Frantz Filter synthetic media is the only filter media of its kind in the industry.

Results Matter

The chart shown on the right, is a result of a 3rd party oil analysis conducted by Blackstone Laboratories. These numbers come from a 6.0 L Powerstroke F-350 with over 215,000 miles.

The initial sample was drawn from the dirty motor oil, that had been run for 4,711 miles (close to its next scheduled oil change). The test results revealed 41,182 contaminating particles at 2 microns just in this small sample. The next sample was drawn from the same dirty oil (without being changed) after adding a Frantz Filter for just 200 miles. This test revealed just 1,641 contaminating particles at 2 microns. That's an astounding 96% decrease in

REMOVING THE SMALLEST PARTICLES IS THE KEY TO ENGINE LIFE		

contamination after just 200 miles! The final sample was taken from brand new Shell Rotella Motor Oil, which revealed 1,818 contaminating particles at 2 microns. So when comparing the analysis of running dirty oil through the Frantz Filter for 200 miles to the analysis of brand new oil, it is evident that the Frantz Filter keeps your oil analytically cleaner than brand new oil. ■
